

# Interoperability of Sustainability Data

## Understanding the Critical **Entity** and **Geospatial** levels

# Domains of interoperability

The 3 major domains of interoperability include:

1. **Semantic: *Definition*** or detailed meaning or purpose of indicators & metrics

*For example, is child labor defined as age 13 or 15? Is working on family farm outside of school hours prohibited?*

2. **Syntactic: *Rules*** pertaining to the data.

*For example, who, when, how... So, what process or resolution level is required to determine deforestation and what sat. data sets or frequency are acceptable.*

3. **Structural: *Format*** for how data is stored and transmitted.

*For example, JSON vs csv, wide vs narrow.*

# Interoperability

Consists of the **guidelines** that allow different information systems to functionally comprehend and utilize information shared between them.

To succeed, interoperability must be:

- **Pragmatically useful** or fit for purpose
- **Commonly accepted** as credible and science-based
- **Accessible to most** (cost + ease of use)

# Entity-level understanding of Farm Income...

# Entity Types

Prime Focus

Producer<sup>1</sup>

Smallholders  
Larger estates

Collection  
Site<sup>2</sup>

Entity sourcing directly  
from farm (e.g.  
cooperative, trader)

Intermediary<sup>3</sup>

-Importers  
-Exporters  
-Processors

Brand -  
Retailer

Consumer

# Examples of entity-level attributes

1

## **Demographic Identifiers**

- Location
- Gender
- Total Area

2

## **Compliance**

- Child or Forced Labor
- Banned Pesticides
- Deforestation

3

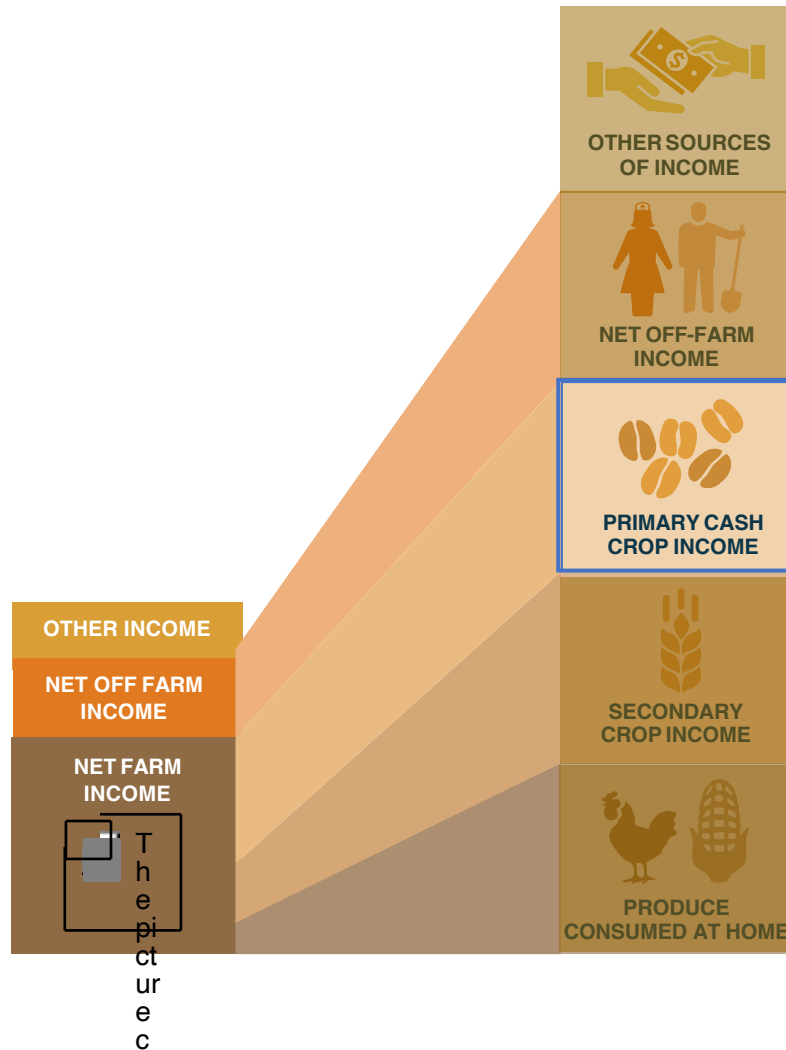

## **Sustainability Performance**

- Climate Resilience
- Food Security
- Income & Productivity

## Interoperability requires agreement, not this:

Company A	Project B	NGO C				Company Z
Revenue	Net Income	Farm Gate Price				Living Income
Water Footprint	Water Mgmt.	Irrigation type				Water Volume
Worker Housing	Human Rights	GAP				Labor contracts

# Entity-level topic: Farm Income

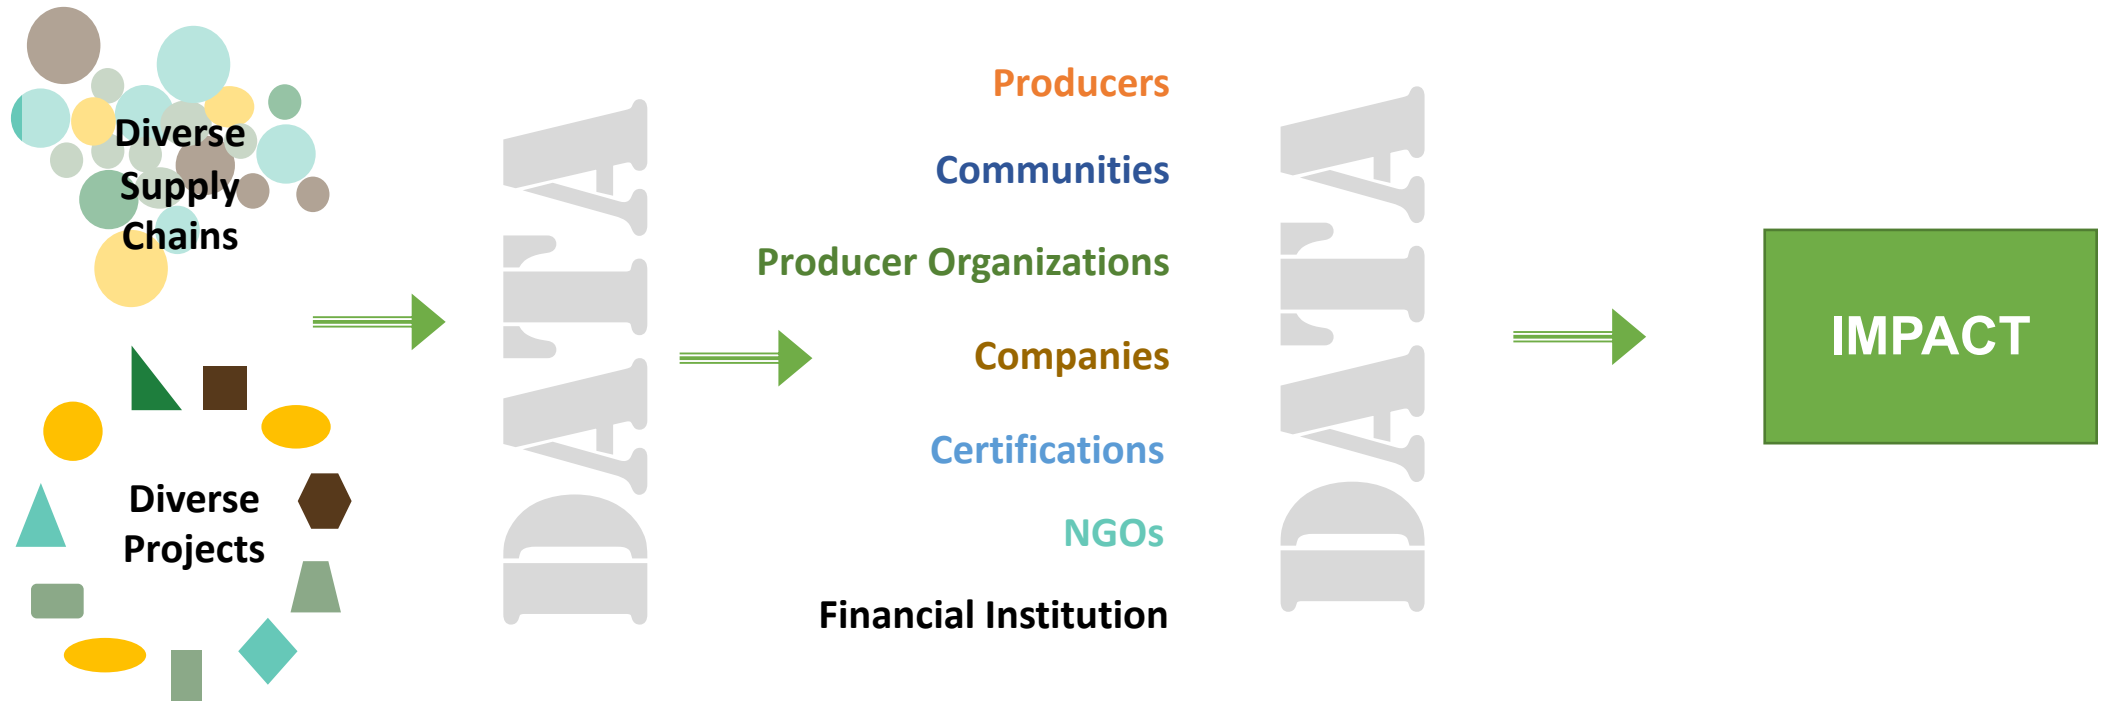

**Living Income** relies on regular and reliable data to accurately calculate income gaps to support the awareness and the understanding of Living Incomes

$$= \text{Price} \times \text{Yield} - \text{Cost of production}$$

**IDB | LAB Complex case study**

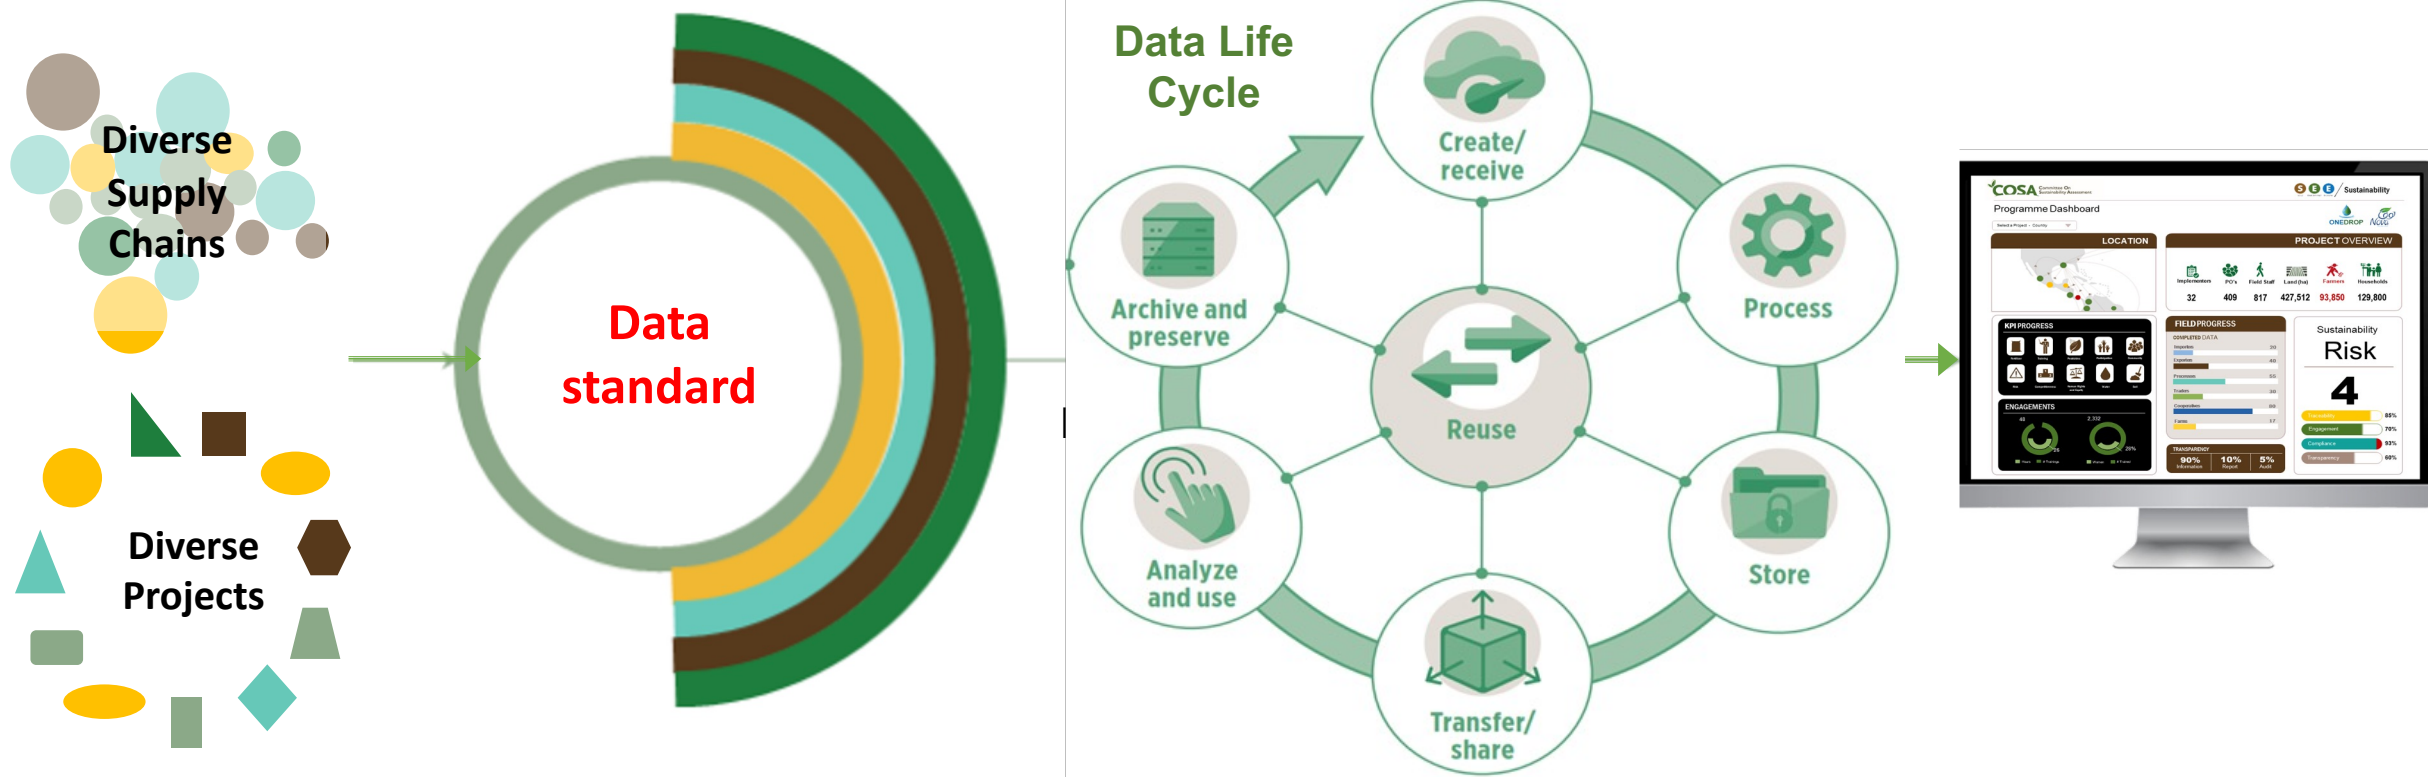

# IDB | LAB Complex case study

**CONSISTENTLY**

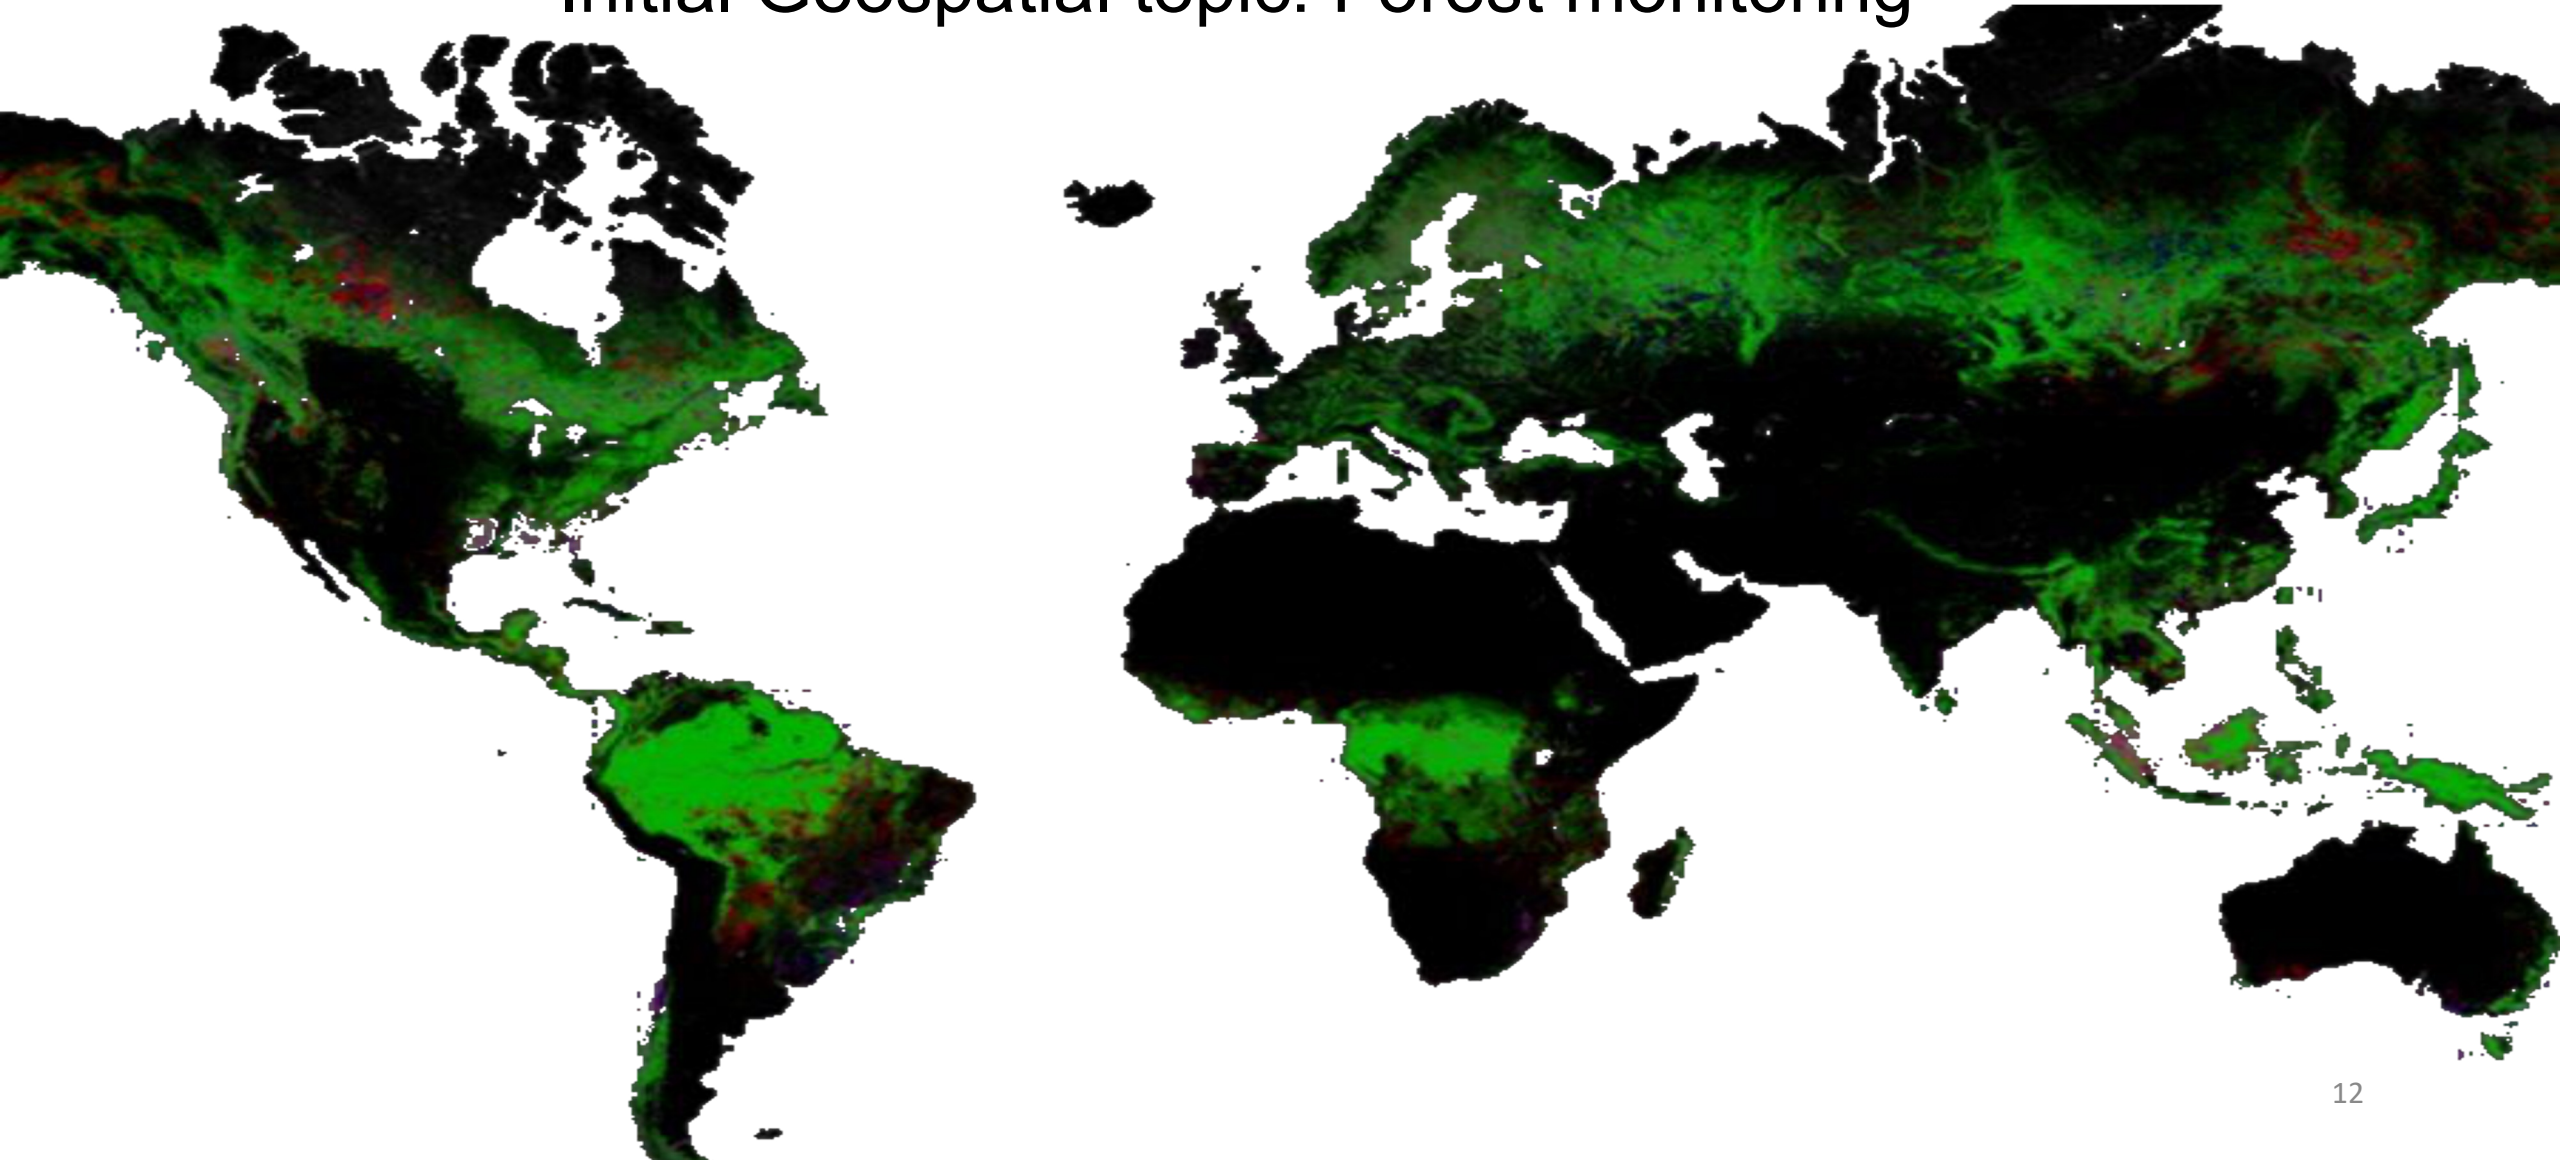

Learning and benchmarking

Data-based  
decisions

# Geospatial: start with Forest Monitoring

## Initial Geospatial topic: Forest monitoring

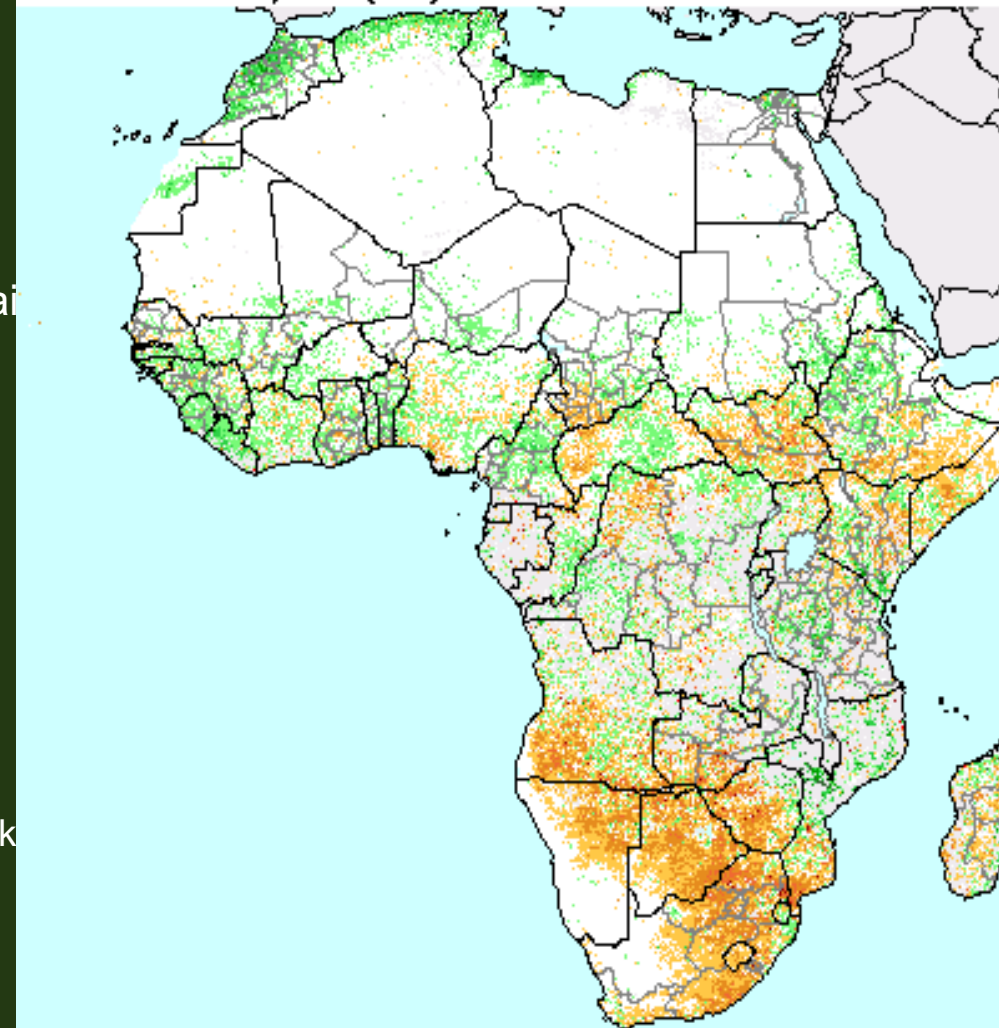

## Sample of the 235 available GADAS datasets

1. Percent Normal Rainfall (6 international sources, updated daily) + 7-14 day Rainfall
2. NASA Microwave soil moisture (surface, subsurface, percent total)
3. Temperature forecasts (weekly Minimum & Maximums)
4. MODIS NDVI Vegetation Index anomaly (8-day summaries)
5. SPI Drought Alert (monthly)
6. Global Agricultural Lands e.g. rice lands (30-meter and mask)
7. Specific Croplands globally (500-meter and mask)
8. Global Crop Distribution IFPRI (34 crops; Area, Yield, Production, masks at 10-km)
9. Global Total Land Cover (30m & 500m)
10. Lakes & Rivers (SRTM & Hydrosheds scale-dependent)
11. Global Reservoirs, Dams (including major use categories)
12. Global Irrigated Cropland – FAO
13. Geonames in detail - National Geospatial Intelligence Agency
14. Landscan Global Population Densities Oak Ridge National Laboratory

NDVI Departure from Average (MODIS)  
Dec. 11 - Dec. 18, 2018 (NRT)

# Taxonomy & Parameters for Data Architecture

## Sample Indicator Description & Technical Representation

Indicator  
Description  
Fields

Indicator Name	Women's Participation in Training
Indicator ID/Code	Number XX.xx
Element / Theme	Social / Gender
Description	Women attending and completing trainings
Metric	Number and % of participants that complete specifically defined trainings who are women
Unit	Expressed as a number and a percent of total people attending
Report Frequency or Timing	Annually, can be updated as needed
Disaggregation	Data could be disaggregated by regional, municipality, or group level to reduce naming duplications and to determine potential target or focal areas
Benchmarking	UN SDG—5. Gender Equality <a href="https://www.un.org/sustainabledevelopment/gender...">https://www.un.org/sustainabledevelopment/gender...</a>
Performance Standard	A value of 0.5 indicates that the gender gap is zero or close to zero (gender equity).
Limitations	<i>Completion is limited as an output indicator and should be paired with: a) satisfaction; adoption of the training topic objective(s); and outcomes of the adoption.</i>

# Taxonomy & Parameters for Data Architecture

Indicator Name		Women's Participation in Training
Calculation Fields	Calculation: NUMERATOR	For each training conducted, the number of participants who are women
	Calculation: DENOMINATOR	For each training conducted, the total number of participants
	Data Source	Producer Database held by co-op, trader, exporter, or NGO: FarmGender (Gender of farmer) TrainingsAttended (Number of trainings attended)
	Survey Question(s)	For this indicator, data would come from project-level databases that track training attendance (by gender and age). The minimum producer-level question is as follows: Write the name, gender, and age of the persons attending the training sessions: <div> <div>Name</div> <div>Gender</div> <div>Age</div> <div>Training Topic</div> </div> <div> <div>1.</div> <div>_____</div> <div>_____</div> <div>_____</div> <div>_____</div> </div> <div> <div>2.</div> <div>_____</div> <div>_____</div> <div>_____</div> <div>_____</div> </div>
	Validations	FarmGender: three options are valid-- "male", "female" or "other, or prefer not to say" TrainingsAttended: a positive integer
Sample Pseudo Coding	Subject of analysis	Supply chain, program/ project, PO or community level
	Exclusion/ Inclusion Criteria	Includes: Farmers where FarmGender is "FEMALE" Farmers where TrainingsAttended is greater than 0
	Example of coding for the indicator to work in a chosen database.	<pre>women = 0 totalFarmers = 0 for farmer in farmers {     if (farmer.FarmGender = "FEMALE") then {         if (farmer.TrainingsAttended &gt; 0) then women += 1     }     totalFarmers += 1 }</pre>

Reference: *global-unique-id.json*

Globally Unique ID of the farmer of this farm

string

This can be a name or number uniquely identifying the organisation that issues this number. For example 'RAINFOREST-ALLIANCE' when they issued the identifier or 'BURUNDI' when it is a national ID.

identifier

string

The identifier issued by the organisation. Can be the Chamber of Commerce number or other number

3.1.3 Location of the farm

Property name: location

Reference: *farm-location.json*

GPS should be captured for each farm plot if possible. GPS readings should be taken outside of buildings and away from significant tree coverage to avoid interference in the signal. GPS should be captured in the middle of the plot, and/or near the entrance to any main building (if there is one). Where the main residence or other buildings are not located on the farm plot, GPS should be taken in the middle of the plot.

The location of the farm

geoLocation

GeoJSON Point

positionTakenAt

constant string Location of the front door of the head office

3.1.4 Farm address

Property name: address

Reference: *address.json*

This should be the location of the farm itself (main plot), not the home of the farmer, if different.

The address
